BAC 338531 (CIT-HSP 490g23) is adjacent to cosmid F24498 to the left and overlaps BAC 52850 (CIT-HSP 6117) to the right by approximately 35 kb. Accession does not represent the sequence of the entire BAC clone insert at this time. Additional chr 19 map and sequence

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is a new DNA which encodes an immunogenic poof a prostate tumour protein. The encoded immunogen, or the DNA ican be used as a vaccine for the treatment of prostate cancer. The was identified by analysis of a subtracted cDNA library obtained subtracting a prostate tumour cDNA expression library with a norm tissue cDNA library.

                             Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers Claim 1; Page 112; 141pp; English.

This sequence represents a human prostate tumour specific gene, and car be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

                                                                                                                                                                                                                          Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Claim 3; Page 104; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic port. of a prostate tumour protein. The encoded immunogen, or the DNA its can be used as a vaccine for the treatment of prostate cancer. The laws identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

Claim 1; Page 115; 141pp; English.

This sequence represents a human prostate tumour specific gene, and car be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                     cancers.

The sequence is that of the Tub Interactor gene hTI-1 which codes for a putative serine protease. TI genes function in biochemical pathways involved in weight control and related disorders. The products can be used for treating weight disorders, e.g. obesity, cachexia or anorexia nervosa, or a related disorder such as diabetes. The products can also be used to modulate cell cycle progression and apoptosis. They can be used for treating neurodegenerative diseases.

This DNA encodes a human prostate-specific kallikrein (HPSK). A host cell containing an expression vector comprising the HPSK nucleic acid sequence can be used to produce the protein recombinantly. The HPSK products can be used for the diagnosis of conditions or diseases associated with expression of HPSK such as prostate carcinoma and benign prostate expression of the such as prostate carcinoma and benign prostate hyperplasia. Agonists and antagonists which specifically bind to HPSK and modulate its activity can be used for the preparation of treatment of such conditions or diseases. The products can also be used for detection and drug screening, especially for the detection of prostate-specific kallikrein (PSK).

Claim 1; Page 114; 141pp; English.
This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                          V61251 standard; cDNA; 145

The present sequence is a new DNA which encodes an immunogenic po of a prostate tumour protein. The encoded immunogen, or the DNA i can be used as a vaccine for the treatment of prostate cancer. The was identified by analysis of a subtracted cDNA library obtained subtracting a prostate tumour cDNA expression library with a norm tissue cDNA library.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                P-PSDB; W69389.

Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers

Claim 1; Page 116-117; 141pp; English.

This sequence represents a human prostate tumour specific gene, and car be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate cancers.
Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Claim 3; Page 108-109; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                             V61253;

New nucleic acids encoding human secreted proteins - obtained from cDNA libraries prepared from e.g. liver, ovary, brain, prostate, kidney, lung, umbilical cord, placenta and colon tissue Claim 1; Page 205; 824pp; English.

X41094 to X41347 represent 5' expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in X12261 to X12514, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, chemotactic/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          was identified by analysis subtracting a prostate tumo tissue cDNA library.
                                                                                                                                                                                                                                                                                                             (GEST ) GENSET.

Isolation of gene conveying post-translational characteristic e.g. the presence of soluble or membrane bound oligo or polysaccharide or glycosyltransferase.

Disclosure; Fig 3; 155pp; English.

The DNA encodes a protein sequence capable of functioning as a GDP- Fuc:[beta-D-Gal alpha(1,2)- fucosyltransferase. The sequence coded by nucleotides 4782 - 5780 represents the functional protein. The enzyme produced by the DNA sequence can be used in enzymatic
                                                                                                                                                                                                                                                                                         WO9112340-A.

ligand activity, anti-inflammatory activity, tumour inhibition activity
or other activities. The products can be used in forensic, gene therapy
and chromosome mapping procedures. The sequences can also be used for
obtaining corresponding promoter sequences. The nucleic acids encoding
the signal peptide can be used for directing extracellular secretion of
a polypeptide or the insertion of a polypeptide into a membrane, or
importing a polypeptide into a cell.

                                                                                                                                                                                              DNA fragment encoding a glycosyltransferase - can be used for in vitro reactions to modify cell surface oligosaccharide(s) e.g. blood gp. determinants, to protect against transplant rejection Disclosure; Fig 3; 249pp; English.

The sequence is that encoding human glycosyl transferase. The enzyme produced by the DNA may be non glycosylated. This prevents premature loss of enzyme activity. It can also be used in in vitro reactions to modify cell surface oligosaccharide mols. e.g. blood group determinants. See also Q56905-12.
